>>> datepat.findall(text)
['11/27/2012', '3/13/2013']
>>>
```

findall() returns a list of strings, one for each match. The strings are the substrings of text that match the pattern.

```
>>> datepat = re.compile(r'(\d+)/(\d+)/(\d+)')
>>>
```

datepat is a compiled regular expression object. It can be used to find all matches in a string.

```
>>> m = datepat.match('11/27/2012')
>>> m
<_sre.SRE_Match object at 0x1005d2750>
>>> # Extract the contents of each group
>>> m.group(0)

...     print('{}-{}-{}'.format(year, month, day))
...
2012-11-27
2013-3-13
>>>
```

findall() returns a list of strings, one for each match. The strings are the substrings of text that match the pattern. finditer() returns an iterator that yields match objects for each match.

```
>>> for m in datepat.finditer(text):
...     print(m.groups())
...
('11', '27', '2012')
('3', '13', '2013')
>>>
```

import math
class Circle:
    def __init__(self, radius):
        self.radius = radius

    @property
    def area(self):
        return math.pi * self.radius ** 2
```

```

@property
def diameter(self):
    return self.radius * 2

@property
def perimeter(self):
    return 2 * math.pi * self.radius

```

The `Circle` class has two properties, `diameter` and `perimeter`, which are calculated based on the `radius` attribute. The `diameter` property is simply twice the radius, and the `perimeter` property is calculated using the formula $2 \times \pi \times \text{radius}$.

```

>>> c = Circle(4.0)
>>> c.radius
4.0
>>> c.area # Notice lack of ()
50.26548245743669
>>> c.perimeter # Notice lack of ()
25.132741228718345
>>>

```

The `Person` class has two properties, `first_name` and `last_name`, which are used to store the first and last names of a person.

```

>>> p = Person('Guido')
>>> p.get_first_name()
'Guido'
>>> p.set_first_name('Larry')
>>>

```

The `Person` class has two properties, `first_name` and `last_name`, which are used to store the first and last names of a person. The `get_first_name` and `set_first_name` methods are used to retrieve and set the first name, respectively.

```

class Person:
    def __init__(self, first_name, last_name):
        self.first_name = first_name
        self.last_name = last_name

    @property
    def first_name(self):
        return self._first_name

    @first_name.setter
    def first_name(self, value):
        if not isinstance(value, str):
            raise TypeError('Expected a string')
        self._first_name = value

```

```
# Repeated property code, but for a different name (bad!)
@property

requests module is used to make HTTP requests. The following code snippet shows how to use the requests module to make a GET request to the Python Package Index (PyPI) website.

```

import requests

# Base URL being accessed
url = 'http://httpbin.org/post'

# Dictionary of query parameters (if any)
parms = {
    'name1' : 'value1',
    'name2' : 'value2'
}

# Extra headers
headers = {
    'User-agent' : 'none/ofyourbusiness',
    'Spam' : 'Eggs'
}

resp = requests.post(url, data=parms, headers=headers)

# Decoded text returned by the request
text = resp.text

```

The following code snippet shows how to use the requests module to make a GET request to the Python Package Index (PyPI) website. The code uses the requests module to make a GET request to the URL 'http://httpbin.org/post' with a dictionary of query parameters and a dictionary of headers. The response is then decoded and the text is returned.

The following code snippet shows how to use the requests module to make a GET request to the Python Package Index (PyPI) website. The code uses the requests module to make a GET request to the URL 'http://httpbin.org/post' with a dictionary of query parameters and a dictionary of headers. The response is then decoded and the text is returned.

```

import requests

resp = requests.head('http://www.python.org/index.html')

```

```
status = resp.status_code
last_modified = resp.headers['last-modified']
content_type = resp.headers['content-type']

        c,a = s.accept()
        echo_handler(c)

echo_server(('', 18000))

```

Within a client, you would do this:

```

from socket import socket, AF_INET, SOCK_STREAM

secret_key = b'peekaboo'

s = socket(AF_INET, SOCK_STREAM)
s.connect(('localhost', 18000))
client_authenticate(s, secret_key)
s.send(b'Hello World')
resp = s.recv(1024)

```

        Close the actor, thus shutting it down
        '''
        self.send(ActorExit)

    def start(self):
        '''
        Start concurrent execution
        '''
        self._terminated = Event()
        t = Thread(target=self._bootstrap)

        t.daemon = True
        t.start()

    def _bootstrap(self):
        try:
            self.run()
        except ActorExit:
            pass
        finally:
            self._terminated.set()
```

```

def join(self):
    self._terminated.wait()

def run(self):
    '''
    Run method to be implemented by the user
    '''
    while True:
        msg = self.recv()

# Sample ActorTask
class PrintActor(Actor):
    def run(self):
        while True:
            msg = self.recv()
            print('Got:', msg)

# Sample use
p = PrintActor()
p.start()
p.send('Hello')
p.send('World')
p.close()
p.join()

```

```

    def run(self):
        while True:
            msg = self.recv()
            print('Got:', msg)

# Sample use
p = PrintActor()
p.start()
p.send('Hello')
p.send('World')
p.close()
p.join()

```

The `PrintActor` class is a subclass of `Actor`. It implements the `run` method, which is a loop that receives messages from the mailbox and prints them. The `join` method is used to wait for the actor to finish its execution.

```

def print_actor():
    while True:

        try:
            msg = yield # Get a message
            print('Got:', msg)
        except GeneratorExit:
            print('Actor terminating')

# Sample use
p = print_actor()
next(p) # Advance to the yield (ready to receive)
p.send('Hello')

```

```
p.send('World')
p.close()
```
